one of the most important and successful theories in computational complexity is that of np completeness this discrete theory is based on the turing machine model and achieves a classification of discrete computational problems according to their algorithmic difficulty turing machines formalize algorithms which operate on finite strings of symbols over a finite alphabet by contrast in algebraic models of computation the basic computational step is an arithmetic operation or comparison of elements of a fixed field for instance of real numbers hereby one assumes exact arithmetic in 1989 blum shub

and smale 12 combined existing algebraic models of computation with the concept of uniformity and developed a theory of np completeness over the reals bss model their paper created a renewed interest in the field of algebraic complexity and initiated new research directions the ultimate goal of the bss model and its future extensions is to unite classical discrete complexity theory with numerical analysis and thus to provide a deeper foundation of scientific computation cf 11 101 already ten years before the bss paper valiant 107 110 had proposed an analogue of the theory of np completeness in an entirely algebraic frame work in connection with his famous hardness result for the permanent 108 while the part of his theory based on the turing approach p completeness is now standard and well known among the theoretical computer science community his algebraic completeness result for the permanents received much less attention

in this paper we state a new class of sets and called them fuzzy neutrosophic alpha m closed sets and we prove some theorem related to this definition then we investigate the relation between fuzzy neutrosophic alpha m closed sets fuzzy neutrosophic \square closed sets fuzzy neutrosophic closed sets fuzzy neutrosophic semi closed sets and fuzzy neutrosophic pre closed sets on the other hand some properties of the fuzzy neutrosophic alpha m closed set are given

this book organizes principles and methods of signal processing and machine learning into the framework of coherence the book contains a wealth of classical and modern methods of inference some reported here for the first time general results are applied to problems in communications cognitive radio passive and active radar and sonar multi sensor array processing spectrum analysis hyperspectral imaging subspace clustering and related the reader will find new results for model fitting for dimension reduction in models and ambient spaces for detection estimation and space time series analysis for subspace averaging and for uncertainty quantification throughout the transformation invariances of statistics are clarified geometries are illuminated and null distributions are given where tractable stochastic representations are emphasized as these are central to monte carlo simulations the appendices contain a comprehensive account of matrix theory the svd the multivariate normal distribution and many of the important distributions for coherence statistics the book begins with a review of classical results in the physical and engineering sciences where coherence plays a fundamental role then least squares theory and the theory of minimum mean squared error estimation are developed with special attention paid to statistics that may be interpreted as

coherence statistics a chapter on classical hypothesis tests for covariance structure introduces the next three chapters on matched and adaptive subspace detectors these detectors are derived from likelihood reasoning but it is their geometries and invariances that qualify them as coherence statistics a chapter on independence testing in space time data sets leads to a definition of broadband coherence and contains novel applications to cognitive radio and the analysis of cyclostationarity the chapter on subspace averaging reviews basic results and derives an order fitting rule for determining the dimension of an average subspace these results are used to enumerate sources of acoustic and electromagnetic radiation and to cluster subspaces into similarity classes the chapter on performance bounds and uncertainty quantification emphasizes the geometry of the cramèr rao bound and its related information geometry
